Conclusions

- ▶ Solar Energetic Particle (SEP) events related to
 - ▶ X-ray flares
 - ▶ Coronal Mass Ejections (CMEs)
- ▶ SEP event categories
 - ▶ impulsive events
 - ▶ related to impulsive **flares** (“flare-acceleration”)
 - ▶ enriched in electrons, ^3He and heavy ions
 - ▶ duration from hours to days; “low” intensities
 - ▶ gradual events
 - ▶ related to gradual flares and **CMEs** (“shock-acceleration”)
 - ▶ typically “normal abundances”
 - ▶ duration from days to a week; “high” intensities
 - ▶ hybrid events
 - ▶ flare- and shock-acceleration observed simultaneously, and/or
 - ▶ shock-acceleration of supra-thermals remnant from prior impulsive flares

Ion acceleration at IP
shocks

Conclusions

- ▶ Coronal sources ($r_s \sim R_\odot$)
 - ▶ flares (reconnection E -fields, stochastic acceleration)
 - ▶ coronal shock waves (shock acceleration)
- ▶ Interplanetary sources ($r_s \gg R_\odot$)
 - ▶ interplanetary shock waves
- ▶ Modeled either physically or phenomenologically

Conclusions

- ▶ Gyrating around and streaming along the IMF field lines
- ▶ $\mathbf{E} \times \mathbf{B}$ drift \Rightarrow co-rotation
- ▶ Adiabatic focusing (mirroring)
- ▶ Scattering off magnetic irregularities \rightarrow
 - ▶ diffusion in pitch angle
 - ▶ spatial diffusion
- ▶ Convection with the scattering centers
- ▶ Adiabatic deceleration

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent
models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

Particle transport under strong scattering (*Parker 1965*)

$$\begin{aligned} \frac{\partial f}{\partial t} = & -\mathbf{V} \cdot \nabla f && \text{convection} \\ & + \frac{p}{3} (\nabla \cdot \mathbf{V}) \frac{\partial f}{\partial p} && \text{adiabatic deceleration} \\ & + \nabla \cdot (\boldsymbol{\kappa} \cdot \nabla f) && \text{spatial diffusion} \end{aligned} \quad (\text{PE})$$

f omnidirectional distribution function

\mathbf{V} solar wind speed

$\boldsymbol{\kappa}$ spatial diffusion tensor, $\kappa_{ij} = \kappa_{ij}^{(s)} + \kappa_{ij}^{(a)}$

- ▶ symmetric part: $\kappa_{ij}^{(s)} = \kappa_{\perp} \delta_{ij} + (\kappa_{\parallel} - \kappa_{\perp}) b_i b_j$, $b_i = B_i/B$.
- ▶ antisymmetric part (drifts): $\kappa_{ij}^{(a)} = \frac{1}{3} r_L v \epsilon_{ijk} b_k$.

Notes: (PE) assumes

- ▶ quasi-isotropic particle distributions, $\lambda_{\parallel} \equiv 3\kappa_{\parallel}/v \ll r$
- ▶ frozen-in fluctuating fields
 - ▶ convection velocity neglects wave transport
 - ▶ stochastic acceleration neglected

Diffusive SEP transport

Modeling of SEPs in IP space

Rami Vainio

Introduction

Solar energetic particle events

SEP acceleration and transport

Test-particle models

Particle transport equations

Modeling SEP events

Particle acceleration at shocks

Self-consistent models

Generation of waves by SEPs

Ion acceleration at IP shocks

Conclusions

(PE) can be further simplified for
> 10-MeV solar protons:

- ▶ drifts, adiabatic deceleration and convection neglected
- ▶ if $\kappa_{\perp} = 0$ **assumed**
⇒ diffusion along field lines:

$$\kappa = \kappa_{\parallel} \mathbf{b}\mathbf{b}$$

⇒ radial diffusion model, $\kappa_{rr} = \kappa_{\parallel} \cos^2 \psi = \frac{1}{3} \lambda_{rr} v$

$$\therefore \frac{\partial n_p}{\partial t} = \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \kappa_{rr} \frac{\partial n_p}{\partial r} \right); \quad n_p \equiv \frac{d^4 N}{d^3 r dp} = 4\pi p^2 f = 4\pi I$$

⇒ **Green's function** (e.g. *Wibberenz et al.* 1989)

$$n_p(r, t) = \frac{n_0}{r^3} \left(\frac{r^2}{a^2 \kappa_{rr} t} \right)^{\frac{3}{a}} \exp \left\{ -\frac{r^2}{a^2 \kappa_{rr} t} \right\}, \quad n_0(p) = \frac{a}{\Gamma(\frac{3}{a})} \frac{dN}{dp} \Big|_s$$

for $\lambda_{rr} \propto r^b$ with $a = 2 - b$ and $b < 2$.

Scaling laws from diffusive transport

Modeling of SEPs
in IP space

Rami Vainio

Introduction

Solar energetic particle
events

SEP acceleration and
transport

Test-particle
models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent
models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

Typically, best fit for SEP data given by $b \in [-0.5, 0.5] \Rightarrow$
Green's function

$$n_p(r, t) = \frac{n_0(p)}{r^3} \left(\frac{r^2}{(2-b)^2 \kappa_{rr} t} \right)^{\frac{3}{2-b}} \exp \left\{ -\frac{r^2}{(2-b)^2 \kappa_{rr} t} \right\}.$$

\Rightarrow **Scaling laws** for short SEP injections from
the Sun (impulsive events and gradual
events with $\phi \gtrsim 60^\circ \text{W}$):

$$\begin{aligned} n_s(p) &\propto I(r_\otimes, E, t_{\max}) \\ I(r, t_{\max}) &\propto r^{-3} \\ \mathcal{F}_p(r) = \int_0^\infty I dt &\propto \frac{n_s(p)}{r \kappa_{rr}(r, p)} \propto r^{-b-1} \end{aligned}$$

\Rightarrow r^{-2} -scaling **not applicable** to intensity or fluence
 \Rightarrow fluence spectrum not proportional to source spectrum

Focused transport equation

Modeling of SEPs in IP space

Rami Vainio

Solar energetic particle
events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

Weak scattering ($\lambda_{rr} \gtrsim 0.2 r$) \Rightarrow anisotropic $f \Rightarrow$ (Roelof 1969)

$$\begin{aligned} \frac{\partial f}{\partial t} = & -v\mu \frac{\partial f}{\partial s} && \text{streaming} \\ & -(1 - \mu^2) \frac{v}{2L} \frac{\partial f}{\partial \mu} && \text{focusing} \\ & + \frac{\partial}{\partial \mu} \left(D_{\mu\mu} \frac{\partial f}{\partial \mu} \right) && \text{pitch-angle diffusion} \end{aligned} \quad (\text{FT})$$

f (gyro-tropic) distribution function

s particle position along the field line (co-rotating frame)

v, μ particle speed and pitch-angle cosine (co-rotating frame)

L focusing length, $L^{-1} = -\frac{1}{B} \frac{\partial B}{\partial s}$.

$D_{\mu\mu}$ pitch-angle diffusion coefficient

Note: v only a parameter so the phase space is 2D: (z, μ)

Focused transport equation – solar wind effects

events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

If $V \neq 0$ is taken into account (*Ruffolo* 1995)

$$\begin{aligned} \frac{\partial f}{\partial t} = & -(v\mu + V) \frac{\partial f}{\partial s} && \text{streaming \& convect.} \\ & - \left(\frac{v + \mu V}{2L} \right) (1 - \mu^2) \frac{\partial f}{\partial \mu} && \text{focusing} \\ & + \left(\frac{1 - \mu^2}{2L} V + \frac{dV}{ds} \mu^2 \right) p \frac{\partial f}{\partial p} && \text{adiab. deceleration} \\ & + \frac{\partial}{\partial \mu} \left(D_{\mu\mu} \frac{\partial f}{\partial \mu} \right) && \text{pitch-angle diffusion} \end{aligned} \quad (\text{FT})$$

f (gyro-tropic) distribution function

s particle position along the field line (co-rotating frame)

p, v, μ particle momentum, speed and pitch-angle cosine (wind frame)

L focusing length, $L^{-1} = -\frac{1}{B} \frac{\partial B}{\partial s}$.

V solar wind speed (co-rotating frame)

$D_{\mu\mu}$ pitch-angle diffusion coefficient

Which focused transport equation should we use?

events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ *Ruffolo (1995) and Kocharov et al. (1998)* investigated the solar-wind effects in (FT)
- ▶ Effects pronounced at low ($E \sim 2$ MeV) energies, where
 - ▶ C speeds up transport early in the event
 - ▶ AD and C harden the spectrum late in the event
 - ▶ Effects less pronounced closer to the Sun

Ruffolo (1995)

- ▶ At $E \gtrsim 10$ MeV, we may neglect C and AD effects rather safely for SpW purposes.

Numerical methods to solve FTE

events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ Monte-Carlo simulations (e.g., *Kocharov et al.*, *Vainio et al.*)
 - ▶ trace individual particles in heliospheric fields
 - ▶ scatter (via random generator) elastically in the frame of the scattering center (wind frame)
 - ▶ advantages and disadvantages
 - ↑ easily implemented and tested
 - ↓ rather slowly running codes
- ▶ Finite difference schemes (e.g., *Ng et al.*, *Ruffolo*, *Heras et al.*, *Hatzky et al.*)
 - ▶ solve FTE directly on a grid
 - ▶ advantages and disadvantages
 - ↓ more cumbersome numerical methods needed
 - ↑ faster codes (than MC)

Elements of SEP event modeling

events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

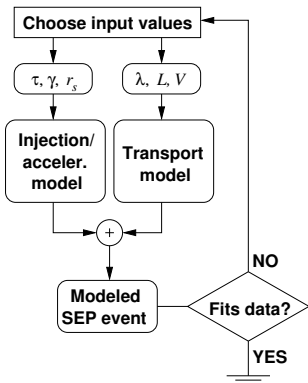

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

SEP observations of

- ▶ omnidirectional intensity

$$I(E, \mathbf{r}, t) \equiv \frac{p^2}{4\pi} \int f(\mathbf{p}, \mathbf{r}, t) d\Omega$$

- ▶ anisotropy

$$\xi(E, \mathbf{r}, t) \equiv \frac{3 \int \mu f(\mathbf{p}, \mathbf{r}, t) d\Omega}{\int f(\mathbf{p}, \mathbf{r}, t) d\Omega}$$

compared with modeled SEP event.

events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ Focused transport equation + SEP injection/acceleration
- ▶ Possible approaches:

- ▶ include source term (*phenomenological*),

$$\frac{\partial f}{\partial t} + v\mu \frac{\partial f}{\partial s} + (1 - \mu^2) \frac{v}{2L} \frac{\partial f}{\partial \mu} = \frac{\partial}{\partial \mu} \left(D_{\mu\mu} \frac{\partial f}{\partial \mu} \right) + \boxed{Q(s, p, \mu, t)}$$

- ▶ use (inner) boundary condition (*phenomenological* or *physical*),

$$f(s_0(t), p, \mu, t)_{\mu > 0} = S_0(p, \mu, t) + F\{f(t)_{\mu < 0}\}$$

- ▶ include a shock in the solar wind speed (*physical*)

$$\begin{aligned} \frac{\partial f}{\partial t} = & -(v\mu + V) \frac{\partial f}{\partial s} - \left(\frac{v + \mu V}{2L} \right) (1 - \mu^2) \frac{\partial f}{\partial \mu} + \frac{\partial}{\partial \mu} \left(D_{\mu\mu} \frac{\partial f}{\partial \mu} \right) \\ & + \left(\frac{1 - \mu^2}{2L} V + \boxed{\frac{dV}{ds} \mu^2} \right) p \frac{\partial f}{\partial p} \end{aligned}$$

Particle acceleration at shocks

Self-consistent models

Generation of waves by SEPs

Ion acceleration at IP shocks

Conclusions

Example: *Heras et al. (1992)*

- Sources: corona & IP shock
- Injection profiles: $R + Q$
- IP transport: λ_{\parallel} and q

Phenomenological source modeling – key results

Modeling of SEPs in IP space

Rami Vainio

Introduction

Solar energetic particle
events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ CME-driven shocks are efficient particle accelerators up to hundreds of MeVs (e.g., *Torsti et al.* 1996, *Anttila et al.* 1998)
 - ▶ Spectra $\propto E^{-\gamma} e^{-E/E_0}$ $\uparrow\uparrow$ shock acceleration
- ▶ The nose region of the shock most efficient in accelerating particles (e.g., *Anttila et al.* 1998)
- ▶ Injection rate Q at the shock increases with shock velocity ratio (e.g., *Lario et al.* 1997)
- ▶ Magnetic connection of the S/C to the shock essential (e.g., *Heras et al.* 1992)
- ▶ Typical values of the interplanetary scattering m.f.p.

$$\lambda_{\parallel} \sim 0.1 - 1 \text{ AU}, \quad \lambda_{rr} = \lambda_{\parallel} \cos^2 \psi \propto r^b, \quad b \sim 0$$

- ▶ Useful approach for creating synthetic SEP events (Space Weather)
 - ▶ Engineering model SOLPENCO (*Aran et al.* 2004)

Physical approach – particle acceleration at shocks

Modeling of SEPs in IP space

Rami Vainio

Introduction

Solar energetic particle
events

SEP acceleration and
transport

Test-particle models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ Diffusive shock acceleration (steady state, shock frame):

$$V \frac{\partial f}{\partial x} - \frac{p}{3} \frac{\partial V}{\partial x} \frac{\partial f}{\partial p} = \frac{\partial f}{\partial x} \left(\kappa \frac{\partial f}{\partial x} \right) + Q_0 \delta(x) \delta(p - p_0) \quad (1D\text{-PE})$$

$$\Rightarrow f = \begin{cases} f_2 \exp\left\{\int_0^x V_1 dx' / \kappa(x')\right\}, & x < 0 \\ f_2 & x > 0 \end{cases}$$

$$f_2(p) = \frac{Q_0 \sigma}{V_1} \left(\frac{p}{p_0} \right)^{-\sigma}, \quad \sigma = \frac{3 V_1}{V_1 - V_2}$$

⇒ Transport equations contain the necessary terms to model IP particle acceleration!

- ▶ Why don't we use them?

SEP acceleration and
transport

Test-particle
models

Particle transport
equations

Modeling SEP events

Particle acceleration at
shocks

Self-consistent
models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

► DSA

$$f = \begin{cases} f_2 e^{\int_0^x V_1 dx' / \kappa(x')}, & x < 0 \\ f_2 & x > 0 \end{cases}$$

$$f_2(p) = \frac{Q_0 \sigma}{V_1} \left(\frac{p}{p_0} \right)^{-\sigma}, \quad \sigma = \frac{3V_1}{V_1 - V_2}$$

► Key parameter: particle acceleration rate

$$\frac{\dot{p}}{p} \sim \frac{V_{sh}^2}{\kappa} \sim \frac{V_{sh}^2}{\lambda v} > \frac{V_{sh}}{r}$$

$$\Rightarrow \lambda < r \frac{V_{sh}}{v} \quad \uparrow \downarrow \lambda_{obs}$$

Introduction

Solar energetic particle events

SEP acceleration and transport

Test-particle models

Particle transport equations

Modeling SEP events

Particle acceleration at shocks

Self-consistent models

Generation of waves by SEPs

Ion acceleration at IP shocks

Conclusions

- ▶ Particles scattered by MHD (Alfvén) waves with

$$\omega = \pm V_A k$$

- ▶ Cyclotron resonance (and a useful approximation)

$$k = \frac{\omega_c}{v\mu \pm V_A} \simeq \frac{\omega_c}{v'}$$

- ▶ Particle scattering leads to isotropy in wave frame
 - ▶ particle energy density in plasma frame increases/decreases
 \Rightarrow wave intensity $I(k)$ decreases/increases
- ▶ Scattering rate and Wave-growth rate

$$D_{\mu\mu} \simeq \frac{\pi}{2} \omega_{ci} (1 - \mu^2) \frac{[k I(k)]_{k=m\omega_c/p}}{B^2}; \quad \lambda = \frac{3v}{8} \int_{-1}^{+1} \frac{(1 - \mu^2)^2}{D_{\mu\mu}} d\mu$$

$$\gamma(k) \simeq \frac{\pi}{2} \omega_{ci} \frac{[p^3 S(p)]_{p=m\omega_c/k}}{V_A n_e}; \quad S = \int v\mu f d\Omega$$

Ion acceleration at IP
shocks

Conclusions

- Observationally (*Reames & Ng 1998*)

$$I_p \lesssim \frac{5 \cdot 10^2}{\text{cm}^2 \text{ sr s MeV}}$$

at MeV energies before
shock arrival

- Can be understood by coronal trapping in self-generated turbulence (*Ng & Reames 1994; Vainio 2003*)
- Model predicts the time-evolution of abundance ratios of high-to-low rigidity ions as well (*Ng et al. 1999*)

FIG. 2.—A histogram of streaming-limited plateau intensities of 4.3–8.7 MeV protons from the GOES spacecraft is compared with the calculated (Ng & Reames 1994) maximum plateau intensity at 1.0 AU.

shocks

Self-consistent models

Generation of waves by
SEPs

Ion acceleration at IP
shocks

Conclusions

- ▶ Problem with Bell's (1D) theory: no particle escape upstream
- ▶ Possible cures:
 - ▶ focusing
 - ▶ time dependence
- ▶ Rice et al., Zank et al., Li et al.
 - ▶ Bell's analytical model in a small region around the shock
 - ▶ ad-hoc free escape boundary upstream
 - ▶ diffusive transport downstream and focused transport upstream
 - ▶ Quasi-steady state model
- ▶ Lee (2005)
 - ▶ Uses $f_- = \int_{-1}^0 f d\mu$ and $f_+ = \int_0^{+1} f d\mu$ instead of $\int_{-1}^{+1} f d\mu$
⇒ self-consistent wave-generation and escape by focusing
 - ▶ Quasi-steady state model
- ▶ Vainio & Laitinen (in preparation)
 - ▶ fully time dependent MC simulations (xpdf/acroread)

Conclusions

- ▶ SEP transport in the interplanetary space in principle well understood
 - ▶ test-particle modeling
 - ▶ self-generated waves
- ▶ Numerical methods to solve the transport equations
 - ▶ Finite difference solutions
 - ▶ Monte Carlo simulations
- ▶ Ad-hoc source modeling has yielded empirical information of
 - ▶ interplanetary transport conditions
 - ▶ interplanetary shock acceleration
- ▶ Physical modeling of interplanetary acceleration has experienced several breakthroughs over the last few years
 - ▶ role of focusing in particle escape
 - ▶ importance of full time dependence in self-consistent modeling
