CHANGE LOG

Reason for change	Issue Nr	Revision Number	Date
Initial release added in SWE Portal 2.2.0: http://swe.ssa.esa.int/release-notes-2.2.0	1	1	13 Sep 2016
Updated for SWE Portal 2.3.0: http://swe.ssa.esa.int/release-notes-2.3.0	2	1	20 Oct 2016
Update for SWE Portal 2.5.0: http://swe.ssa.esa.int/release-notes-2.5.0	3	1	09 Feb 2017
Update for SWE Portal 2.6.0: http://swe.ssa.esa.int/release-notes-2.6.0	4	1	28 Apr 2017
Update for SWE Portal 2.7.0: http://swe.ssa.esa.int/release-notes-2.7.0 <i>Addition of the following products: R.136</i> <i>Modification of the following products: R.130, H.115a, S.101, S.107c</i>	5	1	05 Sep 2017
Update for SWE Portal 2.8.0: http://swe.ssa.esa.int/release-notes-2.8.0 <i>Addition of the following products: G.126, G.127, G.128, G.129, G.130, G.131, G.132, G.133, H.103c, R.102, R.108, R.123, R.124, R.125, R.127</i>	6	1	16 Jan 2018
Update for SWE Portal 2.9.0: http://swe.ssa.esa.int/release-notes-2.9.0 <i>Addition of the following products: G.134, G.135, S.123b, I.133, I.132a, I.132b, I.132c</i> <i>Modification of the following group of products: SIDC, IRF</i>	7	1	22 May 2018
Update for SWE Portal 2.10.0: http://swe.ssa.esa.int/release-notes-2.10.0	8	1	27 Sep 2018

<p><u>Addition of the following products:</u> H.110b, H.101e, H.108b, I.123a, I.123b, I.123c, I.123d, I.123e</p> <p><u>Modification of the following products:</u> H.101a, H.102a, H.103a, H105a, H106a, H.107a, H.108a, H.110a and H113a, R.130 and R.109-R.117 (group), I.121</p>			
<p>Update for SWE Portal 2.11.0: http://swe.ssa.esa.int/release-notes-2.11.0</p> <p><u>Addition of the following products:</u> R.135, R.142-R.157, S.107f, S.123c, S.109c, I.101b, I.134(a,b), I.137, I.138</p> <p><u>Modification of the following products:</u> R.128-R.130</p>	9	1	07 Jan 2019
<p>Update for SWE Portal 2.12.0: http://swe.ssa.esa.int/release-notes-2.12.0</p> <p><u>Addition of the following products:</u> R.133, R.138, H.200a, H.101g, H107c_Mercury, H107c_Venus and H107c_Mars, H.101f, H.107b, S.105d, S.109e, S.108b, S126, I.135a, I.135b, I.136a</p> <p><u>Modification of the following products:</u> R.131, R.132, R.109, R.110, R.111, R.112, R.113, R.114, R.115, R.116, R.117, S.124, I.123a, I.123b, I.123c, I.123d, I.123e</p>	10	1	28 May 2019

Part 3: Facilities supporting the network	201
Facilities Details	201

PURPOSE OF THIS DOCUMENT

The purpose of this document is to list the Space Weather data products available through the ESA Space Weather Service Portal.

The ESA Space Weather Portal provides the main online entry point to the ESA Space Weather Service Network and consequently gives access to a range of space weather products and applications for the twelve SWE Service Domains ('Spacecraft design', 'Spacecraft operation', 'Human spaceflight', 'Launch operation', 'Transionospheric radio communications', 'Space surveillance & tracking', 'Power Systems Operation', 'Airlines', 'Resource Exploitation System Operation', 'Pipeline Operation', 'Auroral Tourism Sector', 'General Data Service') and links all elements of the Space Weather Service Network, including the five Expert Service Centres.

In this document, details of each SWE data product currently available are presented as well as contact information of their provider. Note that this document does not list all Expert Groups participating in each of the Expert Centres with products in development. For this information, the reader is referred to the ESC pages available via the ESA SWE portal (<https://swe.ssa.esa.int>). Only groups actively providing products are listed in this document. The document will be updated following each new product deployment.

This document has been prepared by the ESA Space Weather Services Coordination Centre (SSCC).

Part 1 of this document lists the Space Weather data products available on the SWE Portal.

Part 2 describes the Expert Groups providing these products.

Part 3 describes the facilities supporting the network.

1. SPACE WEATHER PRODUCTS

The first part of this document presents the Space Weather federated products available through the ESA Space Weather Network.

The products are classified per Expert Service Centre (ESC). The different ESC's and contributing number of Expert Groups currently providing SWE data products are:

	Number of Expert Groups	Number of SWE data products
Solar weather	10	50
Heliospheric weather	8	46
Space radiation	15	91
Ionospheric weather	15	87
Geomagnetic conditions	12	79

Note: This table counts all product presented in the SWE Portal except for those marked as "coming soon".

The expert groups referred to here are only those which are currently providing products, and not an exhaustive list of all Expert Groups affiliated with each Expert Service Centre.

This chapter provides a detailed description of the products grouped by Expert Service Centre.

The details of each product provider are gathered in Part 2.

1.1. Solar weather products

S.005a Synchronous synoptic maps of the photosphere

Description

Synchronous synoptic maps are maps of the solar photospheric magnetic field and continuum intensity on the full solar sphere, in heliographic (Carrington) longitude and latitude, where data are taken as close as possible to a reference time. These maps are built from SDO/HMI (NASA Solar Dynamics Observatory mission / Helioseismic and Magnetic Imager) data.

S.017a ASUCAS/SPS White light Solar images

Description

White light synoptic images are provided by ASUCAS/SPS each sunny day (7/7, holidays included). The images are acquired approximately every 60 minutes by a 150/750 mm telescope equipped with a 12 bit CMOS camera (4656×3520 px; 1.05"/px). Final images are stored as FITS files with 2200×2200 pixel size and also as preview images in jpg format.

S.019a ASUCAS/SPS Halpha Solar images

Description

Halpha synoptic images are provided by Solar Patrol Service (SPS)/ASU CAS each sunny day (7/7, holidays included). The images are acquired approximately every 60 minutes by 150/750

mm telescope equipped with 12 bit CMOS camera (4656×3520 px; 1.05"/px). Final images are stored as FITS files at 2200×2200 pixel size and also preview jpg images are produced.

S.042a Solar Magnetic Activity Forecasting

Description

The Solar Magnetic Activity Forecasting tool forecasts the level of solar activity in the near/mid-term future via a proxy of the sunspot number (SSN). In the current version the controlled forecasting horizon of the solar cycle 25 activity level provided by the tool is set to 3 years.

S.050a Synchronous synoptic maps of the solar corona in the UV and extreme-UV

Description

This service provides maps of the radiance in different UV and extreme-UV (EUV) bands on the full solar sphere, in heliographic Carrington coordinates, for a given reference time. These maps are derived from SDO/AIA observations.

Status

S.051a Maps of the thermal structure of the solar corona

Description

This service provides maps of parameters of a Differential Emission Measure (DEM) model as a function of temperature: temperature (T), Emission Measure (EM), width of the DEM, and goodness of fit (χ^2). These maps are derived from SDO/AIA observations.

S.052a Maps of electric currents in Active Region

Description

This service provides maps of the radial component of the electric current density vector in Active Regions, in Cylindrical Equal Area coordinates. These maps are derived from science-level and near-real-time SDO/HMI data.

S.101 Proba2/SWAP Images

Description

The SWAP instrument onboard the Proba2 spacecraft provides full disc solar EUV images in the 174 Angstrom bandpass. The latest level 0 quicklook image is uncalibrated and meant to

monitor instrument status, while the media level image has undergone extensive calibration, image compression and enhancement processing to bring out the best of the image for Space weather forecasting operations.

S.101c SIDC Solarmap

Description

This service allows the user to display solar features (such as sunspot groups, coronal holes, filaments, flares, and coronal mass ejections) on the solar disc. The user can select features and navigate back and forth in time: the closest available observations and images will be displayed. A Heliocentric Earth equatorial (HEEQ) grid of 15 degrees can also be added to refine the feature location on the surface. Additional characteristics of the features (such as time of observation, coordinates of the specified locations, etc.) are also indicated. Additionally, the user can overplot specific locations of interest onto the solar disc. A viewpoint other than Earth can also be specified from a pre-defined list of planetary and spacecraft locations.

S.102 Proba2/LYRA Data

Description

The LYRA instrument onboard the Proba2 spacecraft registers UV and EUV irradiance using 4 different filters. Calibrated level 2 and level 3 (1 minute averaged) data are available in daily FITS-files as well as level 4 calibrated daily PNG plots. The LYRA Rescaled data provide rescaled values from the Aluminium and Zirconium channels which have been cross-calibrated with GOES

X-ray data in order to provide a proxy for X-ray flare intensity. The rescaled data are available in daily TEXT files as well as daily PNG plots.

S.103 SIDC/USET Halpha Solar images

Description

Halpna solar images are produced by the SIDC local observing facilities (Uccle Solar Equatorial Table). The CCD camera is a Qimaging Retiga 4000R. It has an inter-line transfer detector of 2048x2048 pixels. Each pixel is 7.5 micron x 7.5 micron, and the sensitive area is 15.6 mm x 15.6 mm. The H-alpha filter is made by Solar Spectrum. It has a nominal wavelength of 656.2808nm and a bandwidth of 0.05nm. The telescope is a Celestron 80mm ED refractor. The images are provided in FITS files and quicklook PNGs.

S.104 SIDC/USET White light Solar images

Description

Solar white light images are produced by the SIDC local observing facilities (Uccle Solar Equatorial Table). The CCD camera is a Qimaging Retiga 4000R. It has an inter-line transfer detector of 2048x2048 pixels. Each pixel is 7.5 micron x 7.5 micron, and the sensitive area is 15.6 mm x 15.6 mm. The telescope is a Lichtenknecker 150mm diameter achromatic doublet refractor, equipped with full-aperture neutral-density filter with an attenuation of 100,000 (5 densities). The images are provided in FITS files and quicklook PNGs.

S.105a SIDC Humain Callisto Solar radio spectrograms**Description**

This page provides access to the radio spectrograms from the Callisto instrument installed in Humain (Belgium). The spectrometer is plugged to a Sun-tracking broadband antenna and is operated automatically from Brussels. The spectrum covers the band 45 - 440 MHz with 200 samples (frequencies) 4 times per second. The empty "areas" on the spectrum correspond to parts in the spectrum that intentionally not covered to protect the instrument from high power emitters (e.g. FM band).

S.105b eCallisto Solar radio spectrograms**Description**

The e-Callisto Network provides solar radio spectrograms from observing stations spread around the globe. The data are used for the identification of radio bursts as indications of Solar phenomena driving Space Weather. The stations are all equipped with a CALLISTO spectrometer, which is a programmable heterodyne receiver originally built at ETH Zurich in the framework of IHY2007 and ISWI.

S.105c SIDC Automated Solar radio burst detections**Description**

The radio spectrograms obtained by the Callisto instrument installed in Humain (Belgium) are processed by an automated burst detection algorithm that analyses for each individual spectrum (vertical line, in time) its brightness distribution. A burst is detected when the brightness distribution varies significantly in time. The bursts are annotated on the quicklook images. Currently, the algorithm may still trigger false alerts (e.g. fast antenna motion at end and start of observations, lightning due to thunderstorms, strong interferences).

S.105d SIDC/Humain Solar radio light curves**Description**

The Humain Solar Radio Spectrometer (HSRS) is a Software Defined Radio receiver which is plugged to a Sun-tracking broadband antenna in Humain (Belgium). The HSRS observations are rather unique radio observations in Europe that cover a large frequency range including the ones used by the air traffic controllers and some of the GNSS services. This product offers real-time information about the intensity of the Solar radio flux at those specific frequency bands.

S.106 SDO/AIA Solar EUV images

Description

The AIA instrument onboard the SDO spacecraft provides full disc images in several different UV and EUV wavelength bands. The SIDC redistributes AIA 1024 x 1024 pixels AIA quicklook images at a 3 minutes cadence in near-real-time; 4096 by 4096 pixels AIA and HMI images in science quality at a 1 hour cadence; and videos for the last 24 hours of AIA images in all wavelengths for forecasting purposes.

S.107a UGraz/KSO H α Solar images

Description

At Kanzelhöhe Observatory the chromosphere is observed in H α every day from about 8:00 to 16:00 CET/CEST (when the weather is sufficiently clear). The images are processed immediately and available in near real-time as coloured JPEG with a heliographic grid overlaid. Additionally images with removed large scale variations like limb darkening are made available as high contrast images. These images and the raw FITS data is transferred to the archive every five minutes. The 360 degrees panoramic view shows the actual weather conditions at the observatory.

S.107c UGraz/KSO Solar flare detections

Description

Every minute a new full disc H α image of the Sun is acquired at Kanzelhöhe Observatory, the image quality is checked immediately. If the image quality is good enough these images are processed by an image recognition algorithm called surya which detects flaring regions and filaments. If a region reaches a certain intensity and size a flare event is detected. An active region number is given for a detected flare if this number is available for this region.

S.107d UGraz/KSO Solar flare alerts

Description

Every minute a new full disc H α image of the Sun acquired at Kanzelhöhe Observatory, the image quality is checked immediately. If the image quality is good enough these images are processed by an image recognition algorithm called surya which detects flaring regions and filaments. If a region reaches a certain intensity and size a flare event is detected and an alert is issued. The latest alert message is shown here. Only flares of a size larger than 50 microhemispheres will issue an alert. Emails are sent out for flares of at least importance class 1. Registration for flare alert emails is available via the menu entry "Email Subscription".

S.107h UGraz/KSO F10.7 and F30 forecasts

Description

The F10.7 and F30 radio flux indices are used as a proxy of the solar EUV radiation and required by most models to characterize the state of the thermosphere and for thermospheric drag calculation, in order to specify satellite orbits, re-entry services, collision avoidance maneuvers and modeling of space debris evolution. The daily F10.7 and F30 forecasts are optimized for short-term changes with lead times up to 3 days. The plots show the observed data over the last week and over 30 days together with the daily forecasts for one, two and three days into the future. The plots are updated hourly.

S.108 SIDC/SILSO International sunspot number

Description

The World Data Centre for the International Sunspot Number collects observations of sunspots from a network of about 85 observers around the world and produces the daily International Sunspot number and its monthly and yearly means (the time series extends back over several centuries). An estimated sunspot number (EISN) is updated continuously in near-real-time (5 minutes) up to the current day of the month. Provisional numbers for the past month are produced on the first day of each calendar month. A final update of the monthly provisional numbers is done after a delay of 3 months to establish the definitive Sunspot Numbers.

S.501a ASUCAS/SPS Solar flare forecast

Description

Every day at 17:00 UTC an observer/forecaster on duty at ASUCAS/SPS issues a probabilistic flare forecast for three solar flare classes C, M and X. These flare classes are defined according to the peak of the flux of soft X-ray radiation produced by the flare. The forecast consists of two parts: full disc and per visible active regions. Full disc flare forecast then combines the probabilities of flare occurrence in visible active regions into a one global forecast. The forecast is human generated and is valid for next 24 hours from the time of issue.

S.508b CLS F10.7 and F30 nowcast & forecast

Description

Solar radio fluxes measured at 10.7 cm (F10.7) and 30 cm (F30) are good proxies for the EUV forcing of the Earth's upper atmosphere. They are used, for example, as inputs for density models of the thermosphere. Their prediction is therefore of high interest to satellite operators. CLS has developed algorithms to interpolate data gaps, to correct anomalous data and to forecast the indices up to 30 days ahead with a multi-wavelength non-recursive neural network. This service allows the user to visualize and export the nowcast and the forecast values in an human interactive or machine-to-machine way.

1.2. Heliospheric weather products

H.101a Near-Earth solar wind forecasts (Enlil Ensemble)

Description

These forecasts are produced by UK Met Office forecasters using the WSA-Enlil Model and SOHO LASCO coronagraph images. The model is a large-scale, physics-based prediction model of the heliosphere and provides 1-4 day advance warning of solar wind structures and Earth-directed coronal mass ejections (CMEs). For times when there are significant Earthward directed CMEs an additional ensemble panel is produced. This consists of a low resolution version of the Enlil model which is run 24 times with different perturbations on the CME characteristics. Time series plots of the solar wind density and speed at the Near-Earth location are plotted for each member the spread providing an indication of the uncertainty.

H.101e Forecast of solar wind high-speed streams (STEREO+CH)

Description

Since the fast solar wind speed undergoes only long-term changes, as it emanates from long-lived and stable coronal holes, we use a persistence model to forecast the solar wind speed at Earth. An estimate of the uncertainty is provided based on changes to the coronal hole measurements between STEREO-A and Earth. As STEREO-A catches up with Earth the lead-time will reduce to zero at the point the spacecraft crosses the Sun-Earth line (August 2023). It will

then pull ahead of the Earth though the accuracy of the persistence forecast will be reduced due to the increased lead-time (almost a whole solar rotation) allowing more time for coronal hole evolution between observation and time to which the forecast applies. Previous output can be found in the H-ESC archive (see the HPARC/PB product).

H.101g Near-Earth solar wind forecasts (EUHFORIA)

Description

EUHFORIA (v 1.0.3) is a 3D MHD heliosphere model that propagates near-Sun solar wind properties and transient related to CME events out into the heliosphere. This product makes use of the version of EUHFORIA that is installed and accessible via the Virtual Space Weather Modelling Centre VSWMC as described in S. Poedts, 2018. The product is generated on a daily schedule with the latest model results being presented to the user. The EUHFORIA product is run automatically each morning and makes use of the current published Enlil/E configuration available from UK Met Office at that time. This is the version of the product for target Earth. The product is currently considered a prototype and so is only accessible via the H-ESC home page.

H.101h Forecast of solar wind high-speed streams ESWF24

Description

ESWF24 service provides a reliable short-term solar wind speed forecast over three time windows: 24h, 36h and 48h (red, black and green lines, respectively, in the top and middle panels). The algorithm relates solar wind measurements one day ahead with the fractional coronal hole area observed three days before the current moment (ESWF service using NASA SDO/AIA EUV data; see Vrsnak, Temmer, Veronig, 2007). For the data assimilation, in-situ DSCOVR density and speed information is used together with a Kalman filter technique developed by SKOLTECH (Podladchikova et al., 2018 - COSPAR, EGU).

H.101z Solar Wind Forecast Speed Comparison

Description

The H-ESC provides a number of different models to forecast the solar wind speed at Earth. These are based on a variety of inputs techniques such as physics based, use of empirical relations or assumptions on the persistence of conditions from the previous solar rotation or measured by satellites in other locations with solar system. Each model has its own characteristics and caveats that means it may work better or worse depending on current space weather conditions or has other advantages such as fast computation allowing many iteration, ensemble modelling. The H-ESC H.101z combined solar wind speed visualisation product provides a simplified, low-resolution, overview of the various model results in order to aid comparison of the different forecast solar wind speeds over the next few days. This is aimed at supporting the assessment, selection and use of these models.

H.103a Near-Earth CME arrival time predictions (Enlil Ensemble)

Description

This product is generated by Met Office Space Weather Operations Centre (MOSWOC) forecaster based on Enlil model output, described in product description H101a and H101c (ensemble). The CME arrival time forecast will be included within the forecaster's commentary. For times when there are Earthward directed CMEs an ensemble run of the model is also used. This consists of a low resolution version of the Enlil model which is run 24 times with different perturbations on the CME characteristics. The forecasters assess the output to determine the likely spread in arrival times.

H.103c Heliospheric propagation tool

Description

The propagation tool supports the assessment of CME (Coronal Mass Ejections) and CIR (Corotating Interaction Regions) and SEP (Solar Energetic Particle) arrival times at planets, spacecraft and other solar system objects such as comets. It supports the tracking of heliospheric structures using white light J-maps and has access to catalogues of CME/CIR trajectories. It is also connected to science archives of in-situ data (AMDA) and imagery data to assist with posteriori analysis.

H.106b Automated WARNings of Earth arrivals (AWARE)**Description**

This product provides an automated detection and subsequent classification of solar wind disturbances arriving at the L1 point. Focus is on disturbances with a potential for creating geomagnetic storms. Periods of significantly enhanced magnetic field are identified and classified according to their most likely cause, being either propagating ICMEs or high speed streams creating SIRs (including CIRs). In addition, significant interplanetary shocks are identified. Independently Kp is predicted 1-2h ahead based on the latest solar wind measurements. Previous output can be found in the H-ESC archive (see the HPARC product).

H.107c_Mars Mars solar wind forecasts (EUHFORIA)

Description

EUHFORIA (v 1.0.3) is a 3D MHD heliosphere model that propagates near-Sun solar wind properties and transient related to CME events out into the heliosphere. This product makes use of the version of EUHFORIA that is installed and accessible via the Virtual Space Weather Modelling Centre VSWMC as described in S. Poedts, 2018. The product is generated on a daily

schedule with the latest model results being presented to the user. The EUHFORIA product is run automatically each morning and makes use of the current published Enlil/Ma configuration available from UK Met Office at that time. This is the version of the product for target Mars. The product is currently considered a prototype and so is only accessible via the H-ESC home page.

H.108b CME arrival time predictions (Drag Based Ensemble Model Tool)

Description

The Drag-Based Ensemble Model (DBEM) tool provides predictions of the Interplanetary Coronal Mass Ejection (ICME) travel and its arrival at an arbitrary ecliptic-plane location. Calculations are based on the standard DBM assumption that the dominant force is the MHD equivalent of aerodynamic drag. In the ensemble version the model is run multiple times by perturbing input parameters to build up a statistical view of the most likely outcome. The DBEM includes the ability to specify the CME geometry using either cone model or the graduated cylindrical shell model characteristics of the CME. By incorporating dynamic background solar wind speed, now DBEM is able to provide Earthward directed CME arrival times and speed with more accuracy.

H.109a Magnetic Connectivity Tool

Description

The Magnetic Connectivity Tool can help a user to estimate the solar source location of the solar wind and energetic particles measured by different spacecraft. In doing so, the tool will model the coronal and interplanetary magnetic field based on different assumptions and techniques. Currently the coronal model is primarily based on a magnetostatic reconstruction technique called the Potential Field Source Surface (PFSS) model and the interplanetary magnetic field is assumed to be a Parker spiral. If the date/time falls in the future, the tool uses forecasts of magnetic connectivity provided by the ADAPT magnetograms with flux transport. Forecasts of magnetic connectivity will be useful to Solar Orbiter operations and are provided up to 10 days out in the future.

H.109b Shock tool

Description

The shock tool is a fast 3D coronal shock wave propagation module developed to provide quick modeling of shock wave properties in the corona and establish how these shocks connect to specific points of interest in the inner heliosphere. This approach is a first step towards forecasting Solar Energetic Particles (SEPs), the latter feature will be fully implemented in a future update of the tool. At this stage, the Shock Tool forecasts the 3-D expansion speed of a shock wave erupting from a specific Active Region (AR).

H.200a Virtual Space Weather Modelling Centre

Description

The Virtual Space Weather Modelling Centre (VSWMC) is a tool that lets you run space weather models either in a stand-alone way or coupled together. The interfaced models allow for end-to-end simulations from the surface of the Sun to the Earth's magnetosphere, useful for both space weather forecasting and scientific research. The following models are available: EUHFORIA, Wind-Predict, Multi-VP, NARMAX, SPARX, BPiM, GUMICS4, GORGON-SPACE, CTIP and MCM. The user can select or upload the models input of his choosing and the models' output is visualized with inbuilt tools. The different components of the system are spread out on different compute cluster nodes or platforms for better run-time efficiency.

R.103 Space Environment Information System (SPENVIS)

Description

SPENVIS (Space Environment Information System) is a web-based interface for assessing the space environment and its effects on spacecraft systems and crews. The system is used for mission analysis and planning. SPENVIS includes several empirical models of the space

environment covering mainly cosmic rays, solar energetic particles, the natural radiation belts, magnetic fields, space plasmas and the upper atmosphere. A range of engineering models are also available to help assess the effects of the space environment on spacecraft such as surface and internal charging, energy deposition, solar cell damage and SEU rates. Usually these later models take their inputs from the empirical models present in SPENVIS. The system also includes extensive background information on the space environment, the environment models and the related standards.

R.134 The COMESEP Alert System**Description**

The COMESEP (COronal Mass Ejections and Solar Energetic Particles: forecasting the space weather impact) project developed tools for forecasting geomagnetic storms and solar energetic particle (SEP) radiation storms, which were validated and implemented into a space weather alert system that runs without human intervention. When a solar flare or CME is automatically detected, the different modules of the system communicate in order to exchange information. The system displays alerts online and provides notifications for the space weather community.

R.137 DYnamic Atmospheric Shower Tracking Interactive Model Application (DYASTIMA)

Description

DYASTIMA (DYnamic Atmospheric Shower Tracking Interactive Model Application) provides a simulation of the shower cascades generated in a planet's atmosphere due to cosmic rays. The output provides all the available information about the cascade, such as the number, the energy, the direction, the arrival time and the energy deposit of the secondary particles at different atmospheric layers. The DYASTIMA-R extension provides the radiation doses within the atmosphere by calculating the energy that is deposited in a cylindrical phantom, allows a comparison of the contribution from different particles to the total equivalent dose. The user can access a set of already calculated scenarios and can request further case studies.

R.142 SaRIF Risk Indicator Panel

Description

The risk indicator panel is displayed on the front page. The risk indicators provide a high-level indication of the risk of damage to satellites due to space weather. They combine information on the space radiation environment with effects on materials which are commonly used on satellites. Two risk indicators are provided at three representative orbits (GOES-16, GIOVE-A, Slot Region): risk of internal charging due to high energy electrons, and risk of degradation of electronic components due to dose rate and total ionising dose (TID). The archive of the risk indicators for GOES-14 and GOES-15 orbits is also available.

R.145 SaRIF GOES-16 Radiation Environment

Description

This is a multi-plot product consisting of six time-series from the past week. A 24-h forecast is provided for three of the plots. The first two plots represent the GOES-16 environment. The multi-plot time-series displayed are: BAS-RBM >2 MeV electron flux from 2-7 L*, with a 24 h forecast, BAS-RBM modelled and satellite observed (where available) >2 MeV electron flux at the representative satellite orbit, with 24 h model forecast; Kp, with 24 h forecast; IMF Bz and solar wind (SW) velocity measured by DSCOVR/ACE; Dst and SW pressure measured by DSCOVR/ACE; >10 MeV proton flux measured by DSCOVR/ACE. Separate web pages show the electron flux as a function of time and L* at four selected energies (800 keV, 2 MeV, >800 keV and >2 MeV). An archive of past data is available by selecting the date of interest from above the plots.

R.157 SaRIF Best Reconstruction of the Radiation Environment

Description

The BAS-RBM forecasts are produced with the best available data at the time. Some of the input parameters, such as the Kp index, are usually updated after the event, which can affect the simulations. The BAS-RBM is therefore run once every week (early on the Monday morning) for

the week starting 2 weeks before the current date, making use of the updated information to provide the best reconstruction of the radiation environment. The web page shows the same format of multi-plots as BAS Radiation Environment forecast for the same energy ranges, but reconstructed from the latest observation data. Each simulation shows a week (starting and ending at midnight on Saturday). The latest reconstruction is displayed by default and other dates can be selected from the bar at the top of the web page.

R.158 HESPERIA RELeASE**Description**

The High Energy Solar Particle Events foRecastIng and Analysis Relativistic Electron Alert System for Exploration (HESPERIA RELeASE) model uses the fact that near relativistic electrons (1 MeV electrons travel at 95% of the speed of light) travel faster than ions (30 MeV protons travel at 25% of the speed of light) to predict the proton flux by using the actual electron flux and the increase of the electron flux in the last 30, 60, or 90 minutes. The HESPERIA RELeASE model produces two forecasts: one based on inputs from SOHO/EPHIN and one based on ACE/EPAM electron data for two proton energy channels 15.8-39.8 MeV and 28.2-50.1 MeV. Forecasts are produced with a lead time of 30, 60, and 90 minutes.

R.176 RB-IND Radiation belt activity index for solar array degradation**Description**

The index called R Ratio gives the risk of solar array degradation taking into account an initial specification based on the reference model AP8 Min. This R ratio is the ratio between 4 MeV proton fluences measured by in-situ measurements and derived from AP8 model on a given orbit. This index is available from 2010 to now for 4 orbits: GTO to GEO, LEO to MEO, LEO to GEO and a circular orbit at 8000km.

R.178 Internal charging environment and analysis report

Description

For the measured and forecasted electron environment at GEO, a charging analysis report is provided including the computed maximum electric field, surface voltage potential and charging current for various geometry and material configurations. The report also gives mitigation steps in case there is a risk for ESD. The results are obtained from daily runs through the Virtual Space Weather Modelling Centre.

Status

Product provided for demonstration, not assigned to service.

R.179 Internal charging environment nowcast

Description

Observed GOES-16 high energy electron fluxes at GEO provide an appropriate severe internal charging environment for use in internal charging assessment that could have been experienced in the recent past. The observed electron environment of the past day is used to run DICTAT to provide a nowcast of the maximum electric field, surface potential and charging current for various dielectric material and shielding configurations. The results are obtained from daily runs through the Virtual Space Weather Modelling Centre.

Status

Product provided for demonstration, not assigned to service.

R.211 RB-FAN Radiation Belts Orbits dedicated Risk Alert

Description

The RB-FAN Radiation Belts Orbits dedicated Risk Alert is displayed on the landing page using an overview table. The alerts are designed to provide a high-level indication of the daily risk that a

spacecraft may encounter over a given time period, from yesterday to 3 days ahead, for different orbits (GEO, GNSS, LEO and a user-predefined orbit). The indicator of orbit dedicated risks is based on the combination of the estimation of two specific damaging effects on spacecraft: Deep Charging and Solar Cells degradation. The individual specific risk indicators for effects on spacecraft can be accessed by clicking in the desired box of the Orbit dedicated risks table. A one-month history of these alerts is also provided at the bottom of the landing page. A longer term archive is also available upon request.

R.218 RB-FAN Radiation Belts Quicklook Visualisations

Description

The RB-FAN Radiation Belts Quicklook Visualisations consists of several general plots focusing on the global time evolution of the radiation belts (protons and electrons) from previous day to 3 days ahead. This composite product is displayed partly on the landing page and on a dedicated webpage, reachable from the landing page as a shortcut in the upper panel, and from the drop-down menu in the upper left corner named RB-FAN. It provides a set of quick looks of the dynamics of the radiation belts: animations of the dynamics of the radiation belts over the time period, South Atlantic Anomaly map for a given altitude and L versus time mappings in the equator for both Omnidirectional electron and proton fluxes (several energies proposed). A one-month history is available as well as an archive.

1.4. Ionospheric weather products

I.101b Near-real-time map of the Total Electron Content (TEC) for the European region

Description

DLR's TEC maps for the European region provide information about vertical TEC (VTEC) derived from groundbased GNSS measurements with a latency of not more than 5 minutes and an update rate of 5 minutes. The maps cover the region between 30°N -72°N and 30°W -50°E with 1° in latitude and 1° in longitude spatial resolution.

Status

I.102b Forecast of the Total Electron Content (TEC) for the European region.

Description

DLR's forecast TEC maps for Europe provide information about the vertical TEC (VTEC) one and three hours ahead with a latency of not more than 5 minutes and an update rate of 5 minutes. The maps cover the European region between 30°N – 72°N and 30°W – 50°E with 1° in latitudes and 1° in longitude spatial resolution. The one hour forecast is calculated as a sum of the actual European TEC map and a weighted sum of the temporal TEC gradient of the previous hour and the temporal gradient of the previous day at the same time.

Status

I.105a Equivalent slab thickness for Juliusruh

Description

The equivalent slab thickness is a measure of the width of the shape of the vertical electron density profile of the ionosphere. The equivalent slab thickness is defined by the ratio of the total electron content (TEC) and the peak electron density of the local ionosphere. To compute the peak electron density, vertical sounding data from the Juliusruh ionosonde stations is used. The corresponding TEC data are extracted from the TEC maps.

I.117 Near-real-time TEC maps for the European region (based on the TaD model)

Description

Four different maps are produced for the European region each 15 min of the hour: the map of the integrated electron density from 90km to hmF2 (bottomside TEC), the map of the integrated electron density from hmF2 to the transition height (topside TEC), the map of the integrated electron density from the transition height to 20,000km (Plasmaspheric TEC) and the map of the integrated electron density from 90km to 20,000 km (TEC). The mapped area extends from -10°W to 40°E in longitude and from 34°N to 60°N in latitude, and the spatial resolution of the maps is 1°x1°. The product is based on the 3D electron density grids that are calculated using TaD model (Belehaki et al., 2012; Kutiev et al., 2012) in DIAS system. The maps are made available with a latency of 30 min in both ASCII and PNG formats.

I.121 IONMON TEC maps

Description

The ESA/ESOC Navigation Support Office delivers animations of Total Electron Content (TEC) and TEC Root Mean Square errors (RMS) global maps. The maps are computed with a single layer approach, taking slant range TEC observables derived from dual-frequency Galileo, GPS, GLONASS and BeiDou data, whereby ionospheric TEC is modelled by spherical harmonics in combination with a daily Differential Code Biases (DCBs) fitting. In this single layer approach, the ionospheric TEC is assumed to be condensed on a hollow sphere enveloping the Earth at an altitude of 450 km. On that sphere, the global TEC distribution is then described by a degree and order 15 spherical harmonics function. The function coefficients are determined from GNSS dual-frequency data recorded at maximum 300 globally distributed (typically 220 - 240) ground sites. Model-internal, all computations are conducted in a solar-geomagnetic reference system.

I.123a SISTED (Sunlit Ionosphere Sudden TEC Enhancement)

Description

SISTED is monitoring simultaneous sudden enhancements in the ionospheric Total Electron Content (TEC) using the drift rate (second time derivative) of the ionospheric carrier phase product (LI) which can be derived from the GNSS signals. LI is linearly related to the Slant TEC (STEC) along the satellite-receiver ray path under consideration. The drift rate is used to generate a set of three Impact Parameters (IP). An IP tells (in %) how many satellite-receiver pairs are affected by an abrupt over ionization. The service extracts Near-Real-Time (NRT) data from multiple NTRIP broadcasters, including the ones from the International GNSS Service (IGS, <http://igs-ip.net>) and from the European Reference Frame (EUREF, <http://euref-ip.net>).

I.123b SOLERA-drift

Description

SOLERA (formerly GSFLAI) is based on the impact of ionospheric electron content as response to solar flare activity. The ionospheric response appears as a change in Vertical TEC whose time

derivative has a linear dependency on the cosine of Solar Zenith Angle. This relationship can be used to create a proxy for the time derivative of Solar EUV flux (in the spectral band of 21-34 nm). Validation studies with direct Solar EUV measurements by the SOHO SEM instrument (X-class flares during the years 2001-2011) have shown that the GSLAI proxy for EUV flux rate is accurate particularly during moderate and strong activity. In particular, SOLERA drift rate is tailored to detect solar flares occurrence and includes error bars. The service extracts Near-Real-Time (NRT) data from multiple NTRIP broadcasters, including the ones from the International GNSS Service (IGS, <http://igs-ip.net>) and from the European Reference Frame (EUREF, <http://euref-ip.net>).

I.128 Swarm Rate Of change of TEC (ROT)

Description

The Rate Of change of TEC (ROT) is used to monitor small-scale variability. It is known that large fluctuations in electron content through which the GPS ray is passing can seriously affect GNSS and create radio wave scintillations that degrade significantly solutions for positioning and navigation. With the demand of enhanced accuracy of GNSS alerts on its reliability increase more and more in importance. Swarm ROT is derived from Swarm Total Electron Content (TEC) data and are continuously provided with a 1 Hz cadence.

GFZ Helmholtz Centre for Geosciences (GFZ)

Portal Entry Point

<https://swe.ssa.esa.int/web/guest/gfz-sua-i-federated>

I.129 Swarm Total Electron Content (TEC)

Description

Swarm Total Electron Content (TEC) provides integrated electron density along the line of sight of a GPS ray received at the Swarm satellites (A, B, and C). Each of the Swarm satellite receives up to 8 GPS satellite signals simultaneously; therefore, multiple TEC observations at the same coordinated universal time (UTC) are possible. TEC data are continuously provided for each received GPS satellite with a 1 Hz cadence.

I.131 Swarm Ionospheric Bubble Index (IBI)

Description

Swarm Ionospheric Bubble Index (IBI) provides information on bubble climatology itself as well as on disturbance level of magnetic field data by combining electron density and magnetic field observations. Bubbles (low-latitude post-sunset plasma irregularities) are an intrinsic regular phenomenon in the F-region ionosphere that leaves severe plasma density gradients, magnetic field variations and causes GPS signal scintillations. IBI data are continuously provided with a 1 Hz cadence.

Portal Entry Point<https://swe.ssa.esa.int/AIDA-Ne-N-federated>

I.172 AIDA Global 3D Reconstruction Forecasts of Electron Density (Ne)**Description**

The graphic is an interactive 3D map. This shows the forecasted 2D vertical Total Electron Content (vTEC) map on the 'floor' of the image, and then the forecasted longitudinal and latitudinal slices through the full 3D AIDA model, which can be rotated and zoomed into. Every 5 minutes graphics are issued for the 0.5, 1.5, 3 and 6 hour forecasts from the Ultra-Rapid and Rapid AIDA models with 5 minute latency. The 2D vTEC map is in TEC Units (10^{16} electrons per square meter) and the slices of the full 3D structure are in electron density per m^3 (Ne/m^3).

I.173 AIDA Global Nowcasts of Ionospheric Parameters

Description

These four maps display the vertical Total Electron Content (vTEC), Maximum Useable Frequency at 3000 km (MUF3000), the critical plasma frequency (foF2) and its associated height (hmF2) over the globe as produced by the 3D data assimilation model AIDA. New maps are issued every 5 minutes, an Ultra-Rapid product with 5 minute latency and a Rapid product with 90 minute latency. vTEC is expressed in TECu (10^{16} electrons per square meter), MUF3000 in MHz, foF2 in MHz and hmF2 in km.

I.174 AIDA Global Forecasts of Ionospheric Parameters

Description

These four maps display the forecasted vertical Total Electron Content (vTEC), Maximum Useable Frequency at 3000 km (MUF3000), the critical plasma frequency (foF2) and its associated height (hmF2) over the globe as produced by the 3D data assimilation model AIDA. Every 5 minutes a 0.5, 1.5, 3 and 6 hour forecast are produced from both the Ultra-Rapid product with 5 minute latency and a Rapid product with 90 minute latency. vTEC is expressed in TECu (10^{16} electrons per square meter), MUF3000 in MHz, foF2 in MHz and hmF2 in km.

1.5. Geomagnetic conditions products

G.101 Magnetogrammes from North(West) Europe and Greenland

Description

This product provides magnetograms from several ground magnetometer stations, sorted by responsible institute. Each station measures the variations in the Earth's magnetic field in three directions orthogonal on each other. The measurements are calibrated to the horizontal intensity of the magnetic field vector, H (see figure), the declination, D , and the vertical component of the magnetic field vector, Z (all three components are available at the product page).

Status

DTU Space (DTU)

Portal Entry Point

<https://swe.ssa.esa.int/nrt-mag-federated>

G.102 K-index from magnetometer stations in north Europe

Description

K- index is a 3h interval index that reflects the local geomagnetic activity level at ground. The index output is an integer between 0 and 9 determined by the range of the horizontal geomagnetic components within the 3h interval in consideration.

G.107 Nowcast Kp index

Description

This product shows the 3-hourly nowcast Kp index of global geomagnetic activity during the present UTC day as a bar plot. The height of the bar(s) corresponds to the index value (0 to 9) and the colour represents the geomagnetic activity level (low - green ($K_p < 3.3$), intermediate - yellow ($3 < K_p < 6.3$), high - red ($K_p > 6$)). A smaller version of this plot is given for the preceding 6 days. The nowcast Kp values are calculated at GFZ from near real-time geomagnetic observatory data provided by the contributing observatories. Nowcast values of Kp are typically made available at the end of the measurement interval.

G.108 Most recent definitive Kp index

Description

This product, the so-called musical diagram, shows a plot of the 3-hourly definitive Kp index of global geomagnetic activity during approximately 5 recent solar rotations. A key at the bottom of the plot provides an explanation on how to read it and solar rotation numbers as well as UTC

days are indicated in the plot. The definitive Kp is calculated from K values provided by the contributing observatories. This figure is typically produced with a lag time of one to four weeks, as K values from contributing observatories become available. The contributing observatories report these K values in half-monthly intervals with typical delay times of one or two weeks after each half-monthly interval.

G.109 Kp and Ap index on tabular form**Description**

This product shows a table of the nowcast Kp, ap and Ap index of global geomagnetic activity for the present day and the preceding 14 days. Kp and ap are 3-hourly indices, whereas Ap is a daily index. The index values are given in one line per day. Non-existing values are indicated by 'nan'. Below the table, there are links to two downloadable ASCII-files representing the same information. One file gives Kp (in steps of 0.3 or 0.4 from 0 to 9), ap, and Ap and indicates missing values as 'nan'. The other file gives Kp*10 (in steps of 3 or 4 from 0 to 90), ap and Ap and has 99 and 999 as missing data indicator. ap values are derived from Kp. Ap is the daily average of ap. The nowcast Kp values are calculated at GFZ from near real-time geomagnetic observatory data provided by the contributing observatories. Nowcast values of Kp are typically made available at the end of the measurement interval.

G.110 Kp and Ap index archive

Description

In this product yearly files of the definitive Kp, ap and Ap index are given back to 1932. The index values are given in one line per day. Non-existing values are indicated by 'nan'. Next to the table, there are links to two downloadable ASCII-files representing the same information. One file gives Kp (in steps of 0.3 or 0.4 from 0 to 9), ap, and Ap and indicates missing values as 'nan'. The other file gives Kp*10 (in steps of 3 or 4 from 0 to 90), ap and Ap and has 99 and 999 as missing data indicator. ap values are derived from Kp. Ap is the daily average of ap. The definitive Kp is calculated from K values provided by the contributing observatories. The files are typically updated with a lag time of one to four weeks, as K values from contributing observatories become available. The contributing observatories report these K values in half-monthly intervals with typical delay times of one or two weeks after each half-monthly interval.

G.123 Swarm Polar Electrojet (PEJ)

Description

The location of the Polar Electrojet (PEJ) is determined from magnetic measurements by the Swarm satellites. PEJs (Polar Electrojets) are believed to be the principal cause of magnetic disturbances giving rise to problems in power systems as a result of geomagnetically induced currents. Swarm PEJ product gives the possibility for studying the evolution of PEJ during geomagnetic quiet times and geomagnetic storms, in particular their migration from high- to mid-latitudes. The location and intensity of the PEJ determine the possibility that power supply failure might occur due to ground-induced currents.

G.124 Swarm Field-Aligned Current (FAC)

Description

Swarm satellites provide the Field-Aligned Currents (FACs), which play an important role in magnetosphere-ionosphere interactions. They are the main mechanism of energy coupling from the solar wind into the high-latitude upper atmosphere. As FAC acts as a connector between the magnetosphere and ionosphere at high latitudes, exact information on FACs can help to give constraints on many physical parameters: e.g., ionospheric conductivity. Swarm FAC data are continuously provided with a 1 Hz cadence.

G.153a Nowcast Hp60 index

Description

This product shows the 60-minutes nowcast Hp60 index of global geomagnetic activity during the present UTC day as a bar plot. The height of the bar(s) corresponds to the index value (0 to open-end) and the colour represents the geomagnetic activity level: Low - green ($\text{Hp60} < 3.3$), Intermediate - yellow ($3 < \text{Hp60} < 6.3$), High - red ($\text{Hp60} > 6$). A smaller version of this plot is given for the preceding 6 days. The nowcast Hp60 values are calculated at GFZ from near real-time geomagnetic observatory data provided by the contributing observatories. Nowcast values of Hp60 are typically made available shortly before or after the end of the measurement interval.

G.153b Hp60 and ap60 index in tabular form

Description

This product shows a table of the nowcast Hp60 and ap60 index of global geomagnetic activity for the present day and the preceding 14 days. Hp60 and ap60 are 60-minute indices. The index values are given in one line per day in the 3-hourly interval as for Kp index but instead of one value, three values are provided for each 3-hour interval, from top to bottom. Non-existing values are indicated by -1.000 for Hp60 and -1 for ap60. Below the table, there is a link to a downloadable ASCII-file (that has 30 header lines, all starting with #) representing the information for the present and the preceding 28 days. ap60 values (a linear scale) are derived from Hp60. The Hp60 values are calculated at GFZ from near real-time geomagnetic observatory data provided by the contributing observatories. Values of Hp60 and ap60 are typically made available at the end of the measurement interval.

G.158 SIDC 3-day K-Belgium forecast**Description**

The forecaster on duty at the SIDC produces each day (nominal issue time 12:30 UTC) a forecast of the value of the K-index in Belgium, for time periods of 3 hours. The forecast covers the period of three days, starting from the day of the issue of forecast at 12:00 UTC, and the two consecutive days at 00:00 UTC. Note that the three first values reported at 03:00 UTC, 06:00 UTC, and 09:00 UTC correspond to the measured values.

G.159 GIC indicator plots for Greenland and Northern Europe**Description**

The GIC indicator plots the rate of change of several magnetometer stations in Greenland and Northern Europe. The plots show dH/dt , dD/dt and dZ/dt and help the user to monitor those geomagnetic conditions that could induce unwanted currents in power grids.

G.160 Geomagnetic activity index for the auroral zone, Narsarsuaq

Description

The AZ index is a 33 days archive product provided by DTU, indicating the average deviation from its 24h running mean value in the horizontal intensity of the magnetic field in the auroral zone every hour.

Status

Ready

Provider

DTU Space (DTU)

Portal Entry Point

<https://swe.ssa.esa.int/dtu-az-federated>

G.161 Aurora Nowcast, Greenland

Description

The map show the latest estimated position of the polar ionospheric electrojet, and thus the auroral ovals over Greenland. Additionally a local model of the auroral oval is shown in turquoise (when the magnetic field is active).

Status

Ready

Provider

DTU Space (DTU)

Portal Entry Point

G.163 Real-time one-minute Dst (ASC) as estimated using Ascension Island data

Description

Dst (Disturbance Storm Time) is an index of magnetic activity designed to measure the intensity of the global equatorial electrojet, also known as the ring current.

Status

Ready

Provider

British Geological Survey (BGS)

Portal Entry Point

<https://swe.ssa.esa.int/BGS-g163-federated>

G.164 3-hourly Telluric index (Lerwick, Eskdalemuir, Hartland)**Description**

The telluric, or geo-electric field, index is a measure of disturbance in the horizontal components of the geo-electric field over a 3-hourly interval at each observatory.

Status

Ready

Provider

British Geological Survey (BGS)

Portal Entry Point

<https://swe.ssa.esa.int/BGS-g164-federated>

G.165 GIC Index, Bgic for the UK**Description**

The BGS GIC index, Bgic, is a measure of geomagnetic activity designed to indicate the level of geomagnetically induced current (GIC) in the UK power grid.

Status

G.168 Regional Magnetograms

Description

The product show magnetograms from a large number of ground based magnetometer stations, provided by several institutes. The magnetograms are divided in groups by magnetic latitude and magnetic longitude, enabling the user to explore the dynamic geomagnetic signatures in both the East-West and the North-South direction.

Status

G.172 Local Disturbance indices for the Iberian Peninsula

Description

The product provides plots displaying a quantification of the disturbance of the horizontal component of the geomagnetic field on the ground at three different locations of the Iberian Peninsula: UAH (University of Alcalá), SFS (San Fernando Observatory) and COI (University of Coimbra Observatory). The magnetic disturbance is indicated in the vertical axis in units of nanoteslas (nT) and the time is indicated in the horizontal axis in Universal Time (UT).

G.176 Forecast of SYM-H and ASY-H indices

Description

The SYM-H and ASY-H forecast product provides a one-hour and two-hour forecast for each index, as well as the historical values of the previous indices for the last day, computed by the University of Alcalá. Monitoring metric assesses the Mean Absolute Error (MAE, absolute difference between the predicted value and the actual value of the index) for each prediction horizon and index in nT, providing the MAE for the last day and last month for each forecasting horizon.

G.177 BIGG model geomagnetic perturbations

Description

Latest forecasts of magnetic field perturbations (dB in H, E, and N components) [nT] at various virtual ground magnetometer stations. These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uib-db-bigg-federated>

G.178 BIGG model rate of change of the horizontal geomagnetic field

Description

Latest forecasts of the rate of change of the horizontal magnetic field, dBH/dt (in nT/s), at various virtual ground magnetometer station locations. These forecasts are provided via the 'Bergen Imperial Global Geospace' (BIGG) modelling system drawing on the 'Space Weather Modelling Framework' (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uiB-dbdth-bigg-federated>

G.179 BIGG model Kp

Description

Latest forecasts of the BIGG model Kp-like index. These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uiB-kp-bigg-federated>

G.180 BIGG model SYM-H Index

Description

Latest forecasts of the BIGG model SYM-H index (high-resolution Dst, in nT). These forecasts are derived from the Space Weather Modelling Framework (SWMF) model when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uiB-symh-bigg-federated>

G.181 BIGG model auroral electrojet indices**Description**

Latest forecasts of the auroral electrojet indices (AE, AU, and AL, in nT). These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

G.182 BIGG model subsolar magnetopause standoff distance**Description**

Latest forecasts of the subsolar magnetopause standoff distance (in Earth radii, R_E). These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uiB-mpsd-bigg-federated>

G.183 BIGG model magnetosphere overview

Description

Latest forecasts of the magnetosphere overview. The plots are XZ slices of the magnetosphere showing the pressure (nPa). These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Portal Entry Point

<https://swe.ssa.esa.int/uiB-slice-bigg-federated>

G.184 BIGG model integrated joule heating

Description

Latest forecasts of integrated Joule heating over the Northern Hemisphere [GW]. These forecasts are derived from the Space Weather Modelling Framework (SWMF) and Gorgon Global MHD models when real-time L1 solar wind data are available.

Status

Product provided for demonstration, not assigned to service.

Provider

University of Bergen (UiB)

Products

Code	Name
I.121	IONMON TEC maps
I.122c	S4 nowcast modelled maps
I.122d	SigmaPhi nowcast modelled maps
I.122e	TEC nowcast modelled maps
I.122f	S4 6-hour forecast modelled maps
I.122g	SigmaPhi 6-hour forecast modelled maps
I.122i	S4 nowcast modelled values at a given location
I.122j	SigmaPhi nowcast modelled values at a given location

Code	Name
I.122k	TEC nowcast modelled values at a given location
I.122l	S4 6h forecast modelled values at a given location
I.122m	SigmaPhi 6h forecast modelled values at a given location
R.104	Space Environment Data System (SEDAT)
R.107	European Debris Impact Database (EDID)
R.201	Space Radiation Application for Spacecraft Operators (SRASO)
